

Arman Yeghiazaryan

Software Architect | Senior Node.js / TypeScript Engineer

📍 Yerevan, Armenia ✉ contact@otanim.com 🌐 otanim.com 🐙 GitHub 🔗 LinkedIn

PROFILE

Software Architect and senior backend/full-stack engineer with 11 years of experience designing, evolving, and operating Node.js/TypeScript, PHP/Laravel, and AWS-backed production systems. Hands-on architecture experience spans high-volume ingestion, concurrency and data-integrity controls, staged migrations, cross-team integrations, security hardening, observability, and production reliability. Comfortable turning ambiguous operational problems into documented designs, measurable trade-offs, and production changes that teams can safely adopt.

ARCHITECTURE & ENGINEERING HIGHLIGHTS

90K+ jobs/day

Owned multi-vendor ingestion from 50+ sources with validation, cleanup, de-duplication, mapping, and synchronization.

Cross-team visibility

Coordinated source onboarding across six countries and automated daily stakeholder reports for ingestion volume and error counts.

Staged migration

Moved a mature Laravel Vapor service in-house with staging soak, low-traffic production cutover, fallback scripts, and post-cutover monitoring.

2M+ requests/day

Designed and operated backend architecture for a high-traffic Node.js/PostgreSQL job platform on AWS.

CORE SKILLS

Architecture: System design, architecture reviews, data-flow design, migration planning, scalability/capacity reasoning, integration boundaries, technical documentation

Cloud & Platform: AWS (RDS, S3, CloudFront, Lambda, API Gateway, EC2, Elastic Beanstalk, IAM), Terraform, Docker, Nginx, Linux

Security & Quality: OWASP-aligned reviews, bug-bounty remediation, secrets management, credential rotation, PII/privacy automation, Jest, PHPUnit, Puppeteer, E2E, CI/CD

Backend: Node.js, TypeScript, Express, PHP, Laravel, REST APIs, background/cron processing

Data & Reliability: PostgreSQL, MySQL, MongoDB, Redis, OpenSearch/Elasticsearch, schema design, row-level locking, concurrency and data-integrity controls

AI Engineering: Human-in-the-loop AI workflows, multi-agent orchestration, model cost/quality evaluation, AI code validation, agent observability, remediation gates

PROFESSIONAL EXPERIENCE

Ringier South Africa (Pty) Ltd

Jun 2021 - Nov 2025

Senior Full-Stack Engineer / Software Architect

Remote - distributed teams across Europe and Africa

- Owned and evolved a multi-vendor job-listing ingestion platform processing 90K+ listings per day from 50+ independent sources, with automated validation, cleanup, filtering, de-duplication, and scheduled synchronization to client platforms.
- Designed a normalization and mapping layer for inconsistent vendor schemas; piloted human-in-the-loop AI mapping, compared multiple models for quality versus cost, and graduated stable mappings to full automation with ongoing exception reporting.
- Root-caused data inconsistencies to unsafe vendor API usage and eliminated resulting race conditions with row-level database locking on affected write paths, preserving correctness without depending on upstream fixes.
- Migrated the mature ingestion service from Laravel Vapor into the in-house platform using staged cutovers: iterative staging fixes, a two-week staging soak, low-traffic weekend production rollout, manual fallback scripts, and another two weeks of monitoring before decommissioning the old flow.
- Coordinated phased source onboarding and validation with teams and stakeholders in Romania, Kenya, Nigeria, South Africa, Poland, and Mauritius; built automated daily reports of ingestion volumes and error counts so each party had direct operational visibility.
- Remediated bug-bounty findings, rotated and secured credentials, investigated attempted use of previously leaked keys through AWS/CloudFront logs, added pre-commit checks to block plaintext secrets, and built automated Google Analytics PII cleanup tooling.

MyJobs Myanmar

Jun 2018 - Jun 2021

Software Architect / Lead Back-End Developer

Remote

- Led backend architecture for a high-traffic job platform handling 2M+ requests per day, building Node.js services and scalable PostgreSQL schemas.
- Operated and evolved AWS workloads across Lambda, API Gateway, EC2, RDS, S3, and CloudFront, adding monitoring and alerting for production reliability.
- Introduced structured automated testing and CI pipelines, improving release confidence and reducing regression risk.
- Provided technical direction to a small distributed team including developers in India and international freelancers, while translating requirements with a non-technical client team in Myanmar; mentored through code/design reviews and pair programming.
- Contributed to hiring by defining roles, designing technical interviews, and conducting assessments.

SELECTED ARCHITECTURE PROJECT

AI-Native IDE Platform <i>Electron / Node.js / TypeScript / React / Vite / AI agent orchestration</i> - Designed a provider-agnostic desktop platform that makes AI coding agents observable, controllable, and cost-efficient, giving developers direct visibility into active tasks, sessions, generated changes, and agent behavior instead of treating agents as opaque chat interfaces. - Built account-aware sessions, reusable prompt workflows, task launch/orchestration flows, session continuity across major AI coding tools, and a secure plugin/workspace extension architecture. - Added validation gates, automated testing, performance profiling, and remediation loops so developers can inspect and understand AI-generated changes and catch regressions before accepting them into the codebase.	2025 - Present
--	-----------------------

EARLIER EXPERIENCE

Inforuptcy Front-End Developer Built React/Redux product features and reusable UI components; collaborated on API contracts and established modern Webpack/Babel tooling.	Jul 2016 - Jan 2018
Simply Technologies Full-Stack Developer Built REST services in Node.js/Express with MongoDB and contributed across React, Angular, Knockout, and build tooling.	Jun 2015 - Jul 2016
LinguaCode (startup) Founder / Full-Stack Developer Founded a multilingual social coding platform for children; shipped desktop and React web applications and ran pilot cohorts with 100+ students across three schools.	May 2015 - Sep 2020
Shirak Technologies SAP Basis Administrator Supported SAP Basis operations, system administration, and JavaScript instruction.	Jun 2014 - Jan 2015

OPEN SOURCE & SELECTED ENGINEERING WORK

Google Analytics PII Cleaner 	Built an automated bulk-cleanup utility using Google Analytics developer APIs for removing PII when the product UI did not provide a practical mass-removal workflow.
Customs Declaration Automation Tool	AI-assisted document-processing workflow for invoices, bank confirmations, and customs forms; reduced a representative declaration workflow from approximately 8 hours to approximately 15 minutes.
Custom Handwriting Font Generator	Electron/Node/React app for personalized Armenian fonts with automated kerning, batch processing, and FontForge/Inkscape export automation.

EDUCATION & LANGUAGES

State Engineering University of Armenia (Polytechnic) Applied Mathematics & Informatics - BSc coursework	Sep 2012 - May 2014	Languages Armenian - Native English - C1 Russian - C1
---	----------------------------	---
